

# Laboratory Fridge and Freezer Monitoring

A small change in temperature can lead to major loss in your lab, especially when working with sensitive materials like medicines. When these conditions drift, quality can be compromised.

Getting monitoring data quickly when conditions drift is another challenge. Too often, the problem is noticed too late and product is spoiled as a result.

## Solution

**Actionable Alerts**

**Spot issues at a glance**

**No manual report handling**

**Automated Compliance**

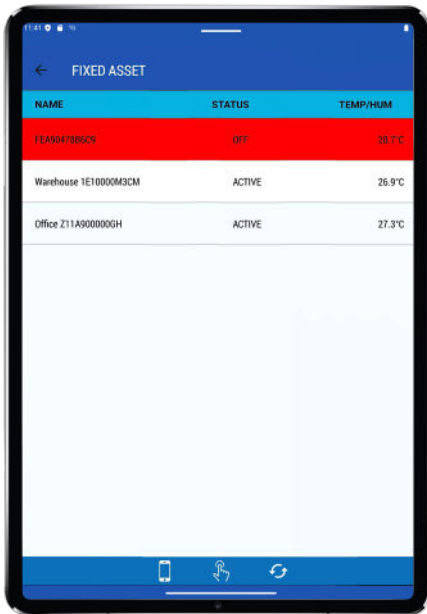

**Audit ready reports in a few taps**

**Streamline compliance, reduce manual steps, and save staff time**

**At-A-Glance  
Monitoring Multiple  
Fridges & Freezers**

# Catch Excursions Before They Become Risks

## Monitor Multiple Fridges at Once

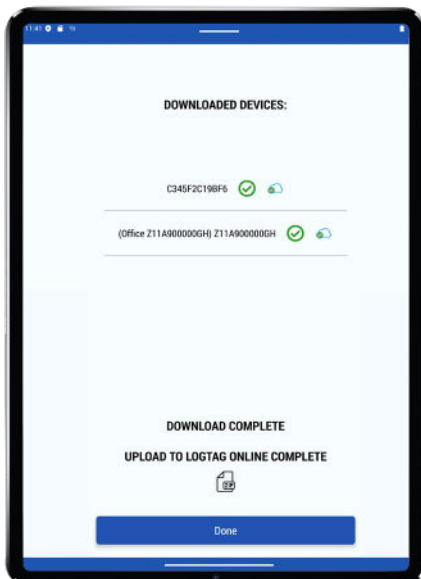

While you focus on daily tasks, simply **glance** at the tablet mounted beside the fridge or freezer. Name each logger so you can quickly identify which fridge or freezer needs corrective action. All your latest recordings are visible at-a-glance.

If conditions move out of range, a **red** warning will appear, so you can take action without adding extra steps to your process.

## Readings on Device

No cable or external probe is needed to monitor your fridge. Simply place the HAXO-16BT inside and start the logger. The logger will begin recording while updating the tablet with the latest data wirelessly.

The latest reading is also shown on the logger screen, so you can check status quickly and easily.

## Audit Ready Report with a Few Taps

When it's time to do reporting, the mobile app handles it for you. Audit ready reports are automatically uploaded to your LogTag® Online cloud account. This will help your team keep records organized and ready for review. Reports are then sent to key staff automatically.
